9
10 A utility golf club that combines a number of features not otherwise found in any one
11 standard golf club. A golf club having a short shaft, a heavy head, a strong loft angle, a
12 deep face, a wide sole, a sharp edge sole pattern, an increased lie angle and hitting
13 surface and sightline alignment aids, can be advantageously employed in a variety of
14 difficult game situations. The short shaft aids precision and increases attack angle.
15 The heavy head helps defeat deep rough and permits a shortened back swing. The
16 deep face assures a greater probability of striking the ball even in the rough where the
17 ball may sit very high. A stronger loft angle is useful for bump and run shots near the
18 greens as well as extricating shots out of the rough. The sharp edge sole pattern
19 permits more consistent shots on hard surfaces. The alignment aids permit accurate
20 orientation of the club head particularly near the green where it can be controlled like a
21 putter. In addition, the preferred embodiment of the invention utilizes a high lie angle
22 and a hosel shifted behind the club head's leading edge to reduce turf contact
23 particularly in the rough and thus minimize induced twisting.
